

# Some Ramsey-theoretic principles in reverse mathematics over a weak base theory

Katarzyna W. Kowalik

(joint work with M. Fiori Carones, L. Kołodziejczyk and K. Yokoyama)

Leeds Computability Days

31 May 2022

# Plan of the talk

1. Some background:
  - | Reverse Mathematics
  - | a weaker base theory  $\text{RCA}_0$
  - | Ramsey's theorem
2. Computational strength of  $\text{RT}_k^n$  and induction axioms
3. First-order consequences of  $\text{RT}_k^n$  over  $\text{RCA}_0$
4. Principles weaker than  $\text{RT}_2^2$
5. Cohesiveness principle

# Reverse Mathematics

- | What are the weakest axioms needed to prove a theorem  $T$ ?  
Can you show they are equivalent to  $T$  over a weak base theory?

# Reverse Mathematics

- | What are the weakest axioms needed to prove a theorem  $T$ ? Can you show they are equivalent to  $T$  over a weak base theory?
- | If  $T$  has the form  $\exists X \forall Y (X \rightarrow Y)$ , how hard is it to compute  $Y$  from  $X$ ? Can you use  $T$  to compute solutions to other principles?

# Reverse Mathematics

- | What are the weakest axioms needed to prove a theorem  $T$ ? Can you show they are equivalent to  $T$  over a weak base theory?
- | If  $T$  has the form  $\exists X \forall Y \phi(X; Y)$ , how hard is it to compute  $Y$  from  $X$ ? Can you use  $T$  to compute solutions to other principles?
- | What else can you prove if you add  $T$  to your base theory? What consequences for finite objects does  $T$  have (= what are its first-order consequences)?

## Second-order arithmetic

Language  $L_2$ : first-order variables:  $x; y; z; \dots$ , second-order variables:  $X; Y; Z; \dots$ , non-logical symbols:  $0; +; <; 2$ .

## Second-order arithmetic

Language  $L_2$ : first-order variables:  $x; y; z; \dots$ , second-order variables:  $X; Y; Z; \dots$ , non-logical symbols:  $0; +; <; 2$ .

Models are of the form  $(M; X)$ , where  $X \subseteq P(M)$ .

## Second-order arithmetic

Language  $L_2$ : first-order variables:  $x; y; z; \dots$ , second-order variables:  $X; Y; Z; \dots$ , non-logical symbols:  $0; +; <; 2$ .

Models are of the form  $(M; X)$ , where  $X \subseteq P(M)$ .

Arithmetical hierarchy:

- |  $\Sigma_n^0$ : formulas with  $n$  alternating blocks of first-order quantifiers starting with  $\exists$ , then only bounded quantifiers  $\exists x \leq t, \forall x \leq t$ ,
- |  $\Pi_n^0$ : defined dually, formulas starting with  $\forall$ ,

## Second-order arithmetic

Language  $L_2$ : first-order variables:  $x; y; z; \dots$ , second-order variables:  $X; Y; Z; \dots$ , non-logical symbols:  $0; +; \cdot; <$ .

Models are of the form  $(M; X)$ , where  $X \subseteq P(M)$ .

Arithmetical hierarchy:

- |  $\Sigma_n^0$ : formulas with  $n$  alternating blocks of first-order quantifiers starting with  $\exists$ , then only bounded quantifiers  $\exists x \leq t, \forall x \leq t$ ,
- |  $\Pi_n^0$ : defined dually, formulas starting with  $\forall$ ,
- | classes  $\Sigma_n^0, \Pi_n^0$  allow set parameters,  $n$ ;  $\Sigma_n^0$  are purely first-order (in language  $L_1: x; y; z; \dots; 0; 1; +; \cdot; <$ ).

# Arithmetical axioms

Given a class of formulas  $\Phi$  we define the following axiom schemes:

1.  $\Phi$  = for each  $\varphi \in \Phi$  the **induction** axiom:

$$\varphi(0) \wedge \forall x(\varphi(x) \rightarrow \varphi(x+1)) \rightarrow \forall x \varphi(x);$$

# Arithmetical axioms

Given a class of formulas  $\Phi$  we define the following axiom schemes:

I = for each  $\Phi \in \Phi$  the **induction** axiom:

$$\Phi(0) \wedge \forall x (\Phi(x) \rightarrow \Phi(x+1)) \rightarrow \forall x \Phi(x);$$

B = for each  $\Phi \in \Phi$  the **collection** axiom:

$$\forall x < a \exists y \Phi(x; y) \rightarrow \exists b \forall x < a \exists y < b \Phi(x; y)$$

# Arithmetical axioms

Given a class of formulas  $\mathcal{L}$  we define the following axiom schemes:

- I = for each  $\varphi \in \mathcal{L}$  the **induction** axiom:  
 $\varphi(0) \wedge \forall x (\varphi(x) \rightarrow \varphi(x+1)) \rightarrow \forall x \varphi(x)$ ;
- B = for each  $\varphi \in \mathcal{L}$  the **collection** axiom:  
 $\forall x < a \exists y \varphi(x; y) \rightarrow \exists b \forall x < a \exists y < b \varphi(x; y)$
- CA = for each  $\varphi \in \mathcal{L}$  the **comprehension** axiom:  
 $\exists X \forall x (x \in X \leftrightarrow \varphi(x))$ .

# Arithmetical axioms

Given a class of formulas  $\Sigma$  we define the following axiom schemes:

- I = for each  $\Sigma \in \Sigma$  the **induction** axiom:  
 $\Sigma(0) \wedge \forall x (\Sigma(x) \rightarrow \Sigma(x+1)) \rightarrow \forall x \Sigma(x)$ ;
- B = for each  $\Sigma \in \Sigma$  the **collection** axiom:  
 $\forall x < a \exists y \Sigma(x; y) \rightarrow \exists b \forall x < a \exists y < b \Sigma(x; y)$
- $\Sigma$ -CA = for each  $\Sigma \in \Sigma$  the **comprehension** axiom:  
 $\exists X \forall x (x \in X \leftrightarrow \Sigma(x))$ .

The traditional base theory is **RCA<sub>0</sub>**

$\Sigma_1^0$ -CA +  $I_1^0$  + basic properties of +,  $\cdot$ , <

RCA<sub>0</sub> is said to correspond to computable mathematics. Its provably recursive functions are precisely the primitive recursive ones. Its first-order part is  $I_1^0$ .

## A weaker base theory

$\text{RCA}_0$  is obtained from  $\text{RCA}$  by replacing  $I_1^0$  with  $I_1^0$  and the axiom  $\text{exp} = \text{„}\mathbb{Z}$  is a total function“.

## A weaker base theory

$\text{RCA}_0$  is obtained from  $\text{RCA}$  by replacing  $I_1^0$  with  $I_1^0$  and the axiom  $\text{exp} = \text{„}\mathbb{Z}$  is a total function“.

- | It was introduced by Simpson and Smith ('86) and is mostly used to identify theorems equivalent to  $\emptyset$ .

## A weaker base theory

$RCA_0$  is obtained from  $RCA$  by replacing  $I^0_1$  with  $I^0_1$  and the axiom  $exp = \lambda x. 2^x$  is a total function".

- | It was introduced by Simpson and Smith ('86) and is mostly used to identify theorems equivalent to  $\emptyset$ .
- | It turned out to be relevant for some results for  $RCA$  (Belanger 2015).

## A weaker base theory

$\text{RCA}_0$  is obtained from  $\text{RCA}$  by replacing  $I_1^0$  with  $I_1^0$  and the axiom  $\text{exp} = \text{„}\mathbb{N}$  is a total function“.

- | It was introduced by Simpson and Smith ('86) and is mostly used to identify theorems equivalent to  $\emptyset$ .
- | It turned out to be relevant for some results for  $\text{RCA}$  (Belanger 2015).
- | The first-order part of  $\text{RCA}_0$  is axiomatized by  $\text{B}_1 + \text{exp}$ .
- | The provably recursive functions of  $\text{RCA}_0$  are precisely the elementary recursive ones.

## A weaker base theory

$RCA_0$  is obtained from  $RCA$  by replacing  $I_1^0$  with  $I_1^0$  and the axiom  $exp = \text{„}\mathbb{N} \text{ is a total function“}$ .

- | It was introduced by Simpson and Smith ('86) and is mostly used to identify theorems equivalent to  $\emptyset$ .
- | It turned out to be relevant for some results for  $RCA$  (Belanger 2015).
- | The first-order part of  $RCA_0$  is axiomatized by  $B_1 + exp$ .
- | The provably recursive functions of  $RCA_0$  are precisely the elementary recursive ones.
- | Over  $RCA_0$ ,  $RCA_0$  is equivalent to the statement „Every infinite set has arbitrarily large finite subsets“.

# Failure of $\Sigma_1^0$ -induction

$I$  is a  $\Sigma_1^0$ -definable proper cut.  
(cut = an initial interval closed  
under successor function)

$A$  is a  $\Sigma_1^0$ -definable unbounded  
set enumerated in increasing  
order by the cut.

# Failure of $\Sigma_1^0$ -induction

$I$  is a  $\Sigma_1^0$ -definable proper cut.  
(cut = an initial interval closed under successor function)

$A$  is a  $\Sigma_1^0$ -definable unbounded set enumerated in increasing order by the cut  $I$ .

We consider  $I$  together with the family of its coded subsets  $\text{Cod}(M=I)$  as a second-order structure.

$X \in \text{Cod}(M=I) \iff \exists s \in M$  s.t.  
 $s$  is (a code for) a finite set  
and  $s \setminus I = X$ .

$\text{SSy}(M) := \text{Cod}(M=I)$

## Ramsey's theorem

For fixed  $n; k \geq 2$ ,  $RT_k^n$  is the sentence „For every  $[N]^n \rightarrow [k]$  there exists an infinite set  $H \subseteq N$  such that  $c_{[H]^n}$  is constant.“.  
(Note: infinite = unbounded.)

# Ramsey's theorem

For fixed  $n; k \geq 2$ ,  $RT_k^n$  is the sentence „For every  $c: [N]^n \rightarrow c$  there exists an infinite set  $H \subseteq N$  such that  $c \upharpoonright [H]^n$  is constant.“.

(Note: infinite = unbounded.)

- Over  $RCA_0$ , there are only two instances of  $RT_k^n$  up to logical equivalence:  $RT_2^2$  and  $RT_2^3$ .

# Ramsey's theorem

For fixed  $n; k \geq 2$ ,  $RT_k^n$  is the sentence „For every  $c: [N]^n \rightarrow k$  there exists an infinite set  $H \subseteq N$  such that  $c \upharpoonright [H]^n$  is constant.“.

(Note: infinite = unbounded.)

| Over  $RCA_0$ , there are only two instances of  $RT_k^n$  up to logical equivalence:  $RT_2^2$  and  $RT_2^3$ .

|  $RCA_0 \not\vdash RT_2^3$ ,  $ACA_0$

(By Jockusch '72 there is a computable  $c: [N]^3 \rightarrow 2$  s.t. every infinite homogeneous set computes  $0'$ )

# Ramsey's theorem

For fixed  $n; k \geq 2$ ,  $RT_k^n$  is the sentence „For every coloring  $c: [N]^n \rightarrow k$  there exists an infinite set  $H \subseteq N$  such that  $c \upharpoonright [H]^n$  is constant.“.

(Note: infinite = unbounded.)

- | Over  $RCA_0$ , there are only two instances of  $RT_k^n$  up to logical equivalence:  $RT_2^2$  and  $RT_2^3$ .
- |  $RCA_0 \not\vdash RT_2^3$ ,  $ACA_0$   
(By Jockusch '72 there is a computable coloring  $c: [N]^3 \rightarrow 2$  s.t. every infinite homogeneous set computes  $\emptyset'$ )
- | Over  $RCA_0$ ,  $RT_2^2$  implies  $B_2^0$  but is not equivalent to any classical subsystem of second-order arithmetic!  
(Jockusch, Hirst, Seetapun and Slaman, Liu)

# Ramsey's theorem

For fixed  $n; k \geq 2$ ,  $RT_k^n$  is the sentence „For every coloring  $c: [N]^n \rightarrow k$  there exists an infinite set  $H \subseteq N$  such that  $c \upharpoonright [H]^n$  is constant.“.

(Note: infinite = unbounded.)

- | Over  $RCA_0$ , there are only two instances of  $RT_k^n$  up to logical equivalence:  $RT_2^2$  and  $RT_2^3$ .
- |  $RCA_0 \not\vdash RT_2^3$ ,  $ACA_0$   
(By Jockusch '72 there is a computable coloring  $c: [N]^3 \rightarrow 2$  s.t. every infinite homogeneous set computes  $\emptyset'$ )
- | Over  $RCA_0$ ,  $RT_2^2$  implies  $B\Sigma_2^0$  but is not equivalent to any classical subsystem of second-order arithmetic!  
(Jockusch, Hirst, Seetapun and Slaman, Liu)
- | What are the first-order consequences of  $RT_2^2$ ?

# Ramsey's theorem

For fixed  $n; k \geq 2$ ,  $RT_k^n$  is the sentence „For every coloring  $c: [N]^n \rightarrow k$  there exists an infinite set  $H \subseteq N$  such that  $c \upharpoonright [H]^n$  is constant.“.

- | They follow from  $\Pi_2^1$  (Cholak, Jockusch, Slaman) and their  $\Sigma_3^1$  part is  $B_2^1$  (Patey, Yokoyama).
- | Open problem: Is  $RT_2^2$  arithmetically conservative over  $B_2^0$ ?

# Equivalence with relativization to $\mathcal{a}_1^0$ -de nable cut

## Theorem

Let  $n; k \geq 2$ . If  $(M; X) \leq \text{RCA}_0$  and  $I$  is a proper  $\mathcal{a}_1^0$ -de nable cut in  $M$ , then

$$(M; X) \leq \text{RT}_k^n \iff (I; \text{Cod}(M=I)) \leq \text{RT}_k^n:$$

# Equivalence with relativization to $\mathcal{a}_1^0$ -de nable cut

## Theorem

Let  $n; k \geq 2$ . If  $(M; X) \leq \text{RCA}_0$  and  $I$  is a proper  $\mathcal{a}_1^0$ -de nable cut in  $M$ , then

$$(M; X) \leq \text{RT}_k^n \text{ i } (I; \text{Cod}(M=I)) \leq \text{RT}_k^n:$$

## Lemma (Chong-Mourad 1990)

Let  $(M; X) \leq \text{RCA}_0$  and  $I$  be a cut in  $M$ . If both  $Y \leq I$  and  $I \leq nY$  are  $\mathcal{a}_1^0$ -de nable in  $M$ , then  $Y \leq \text{Cod}(M=I)$ .

# Equivalence with relativization to $\mathcal{A}_1^0$ -definable cut

## Theorem

Let  $n, k \geq 2$ . If  $(M; X) \models \text{RCA}_0$  and  $I$  is a proper  $\mathcal{A}_1^0$ -definable cut in  $M$ , then

$$(M; X) \models \text{RT}_k^n \iff (I; \text{Cod}(M=I)) \models \text{RT}_k^n$$

## Lemma (Chong-Mourad 1990)

Let  $(M; X) \models \text{RCA}_0$  and  $I$  be a cut in  $M$ . If both  $Y \subseteq I$  and  $I \cap Y$  are  $\mathcal{A}_1^0$ -definable in  $M$ , then  $Y \subseteq \text{Cod}(M=I)$ .

**Proof idea for theorem** ( ) Given a colouring  $c: [M]^n \rightarrow k$  we transfer it onto  $[I]^n$  using the canonical set  $A = \{a_i \mid i \in I\}$ :  
 $\mathcal{A}(i_1, \dots, i_n) := c(a_{i_1}, \dots, a_{i_n})$ . By the Chong-Mourad coding lemma  $\mathcal{A} \subseteq \text{Cod}(M=I)$ . We use  $\text{RT}_k^n$  in  $(I; \text{Cod}(M=I))$  and transfer the solution back to  $M$  using the set  $A$ .

The ( ) direction is similar. □

# Computational strength of $\mathcal{R}_k^n$ in first-order arithmetic

For  $\ell \geq 1; n; k \geq 2$ , let  $\mathcal{R}_k^n$  be the following first-order sentence: For every definable  $k$ -colouring of  $[N]^n$ , there is a definable infinite homogeneous set

# Computational strength of $\text{RT}_k^n$ in first-order arithmetic

For  $n \geq 1; k \geq 2$ , let  $\text{RT}_k^n$  be the following first-order sentence: For every definable  $k$ -colouring of  $[N]^n$ , there is a definable infinite homogeneous set

Every  $\text{RT}_k^n$  is false in the standard model but how much of mathematical induction is needed to disprove it?

# Computational strength of $\text{RT}_k^n$ in first-order arithmetic

For  $\ell \geq 1; n; k \geq 2$ , let  $\text{RT}_k^n$  be the following first-order sentence: For every  $\ell$ -definable  $k$ -colouring of  $[N]^n$ , there is a  $\ell$ -definable infinite homogeneous set

Every  $\text{RT}_k^n$  is false in the standard model but how much of mathematical induction is needed to disprove it?

## Lemma

- (a)  $I_1$  proves that there is a  $\ell$ -definable 2-colouring of  $[N]^2$  with no  $\ell$ -definable infinite homogeneous set,
- (b)  $\text{I}\Sigma_1^{n+2}$  proves that there is a  $\ell$ -definable 2-colouring of  $[N]^n$  with no infinite homogeneous set.

In particular,  $I_1 \not\vdash \text{RT}_k^n$ , for  $\ell \geq 1$ .

# Computational strength of $\text{RT}_k^n$ in first-order arithmetic

For  $\ell \geq 1; n; k \geq 2$ , let  $\text{RT}_k^n$  be the following first-order sentence: For every  $\ell$ -definable  $k$ -colouring of  $[N]^n$ , there is a  $\ell$ -definable infinite homogeneous set.

Every  $\text{RT}_k^n$  is false in the standard model but how much of mathematical induction is needed to disprove it?

## Lemma

- (a)  $\text{I}\Sigma_1$  proves that there is a  $\ell$ -definable 2-colouring of  $[N]^2$  with no  $\ell$ -definable infinite homogeneous set,
- (b)  $\text{I}\Sigma_{n-2}$ ,  $\ell \geq 1$  proves that there is a  $\ell$ -definable  $(n+1)$ -colouring of  $[N]^n$  with no infinite homogeneous set.

In particular,  $\text{I}\Sigma_{\ell} \vdash \neg \text{RT}_k^n$ , for  $\ell \geq 1$ .

**Proof idea.** Repeat the usual argument of Jockusch '72.  $\text{I}\Sigma_{\ell}$  is needed for the claim that any infinite set has arbitrarily large finite subsets. □

# Computational strength of $\text{RT}_k^n$ in first-order arithmetic

## Lemma

Let  $n \geq 3$  and  $(M; X) \models \text{RCA}_0 + \text{RT}_2^n$ . If  $M \models I^*$ , then  $0^{(\omega)} \leq X$ .  
As a consequence,  $\Sigma_{n+1}\text{-Def}(M) \leq X$  and  $M \models \text{B}^{\Sigma_{n+1}}$ .

# Computational strength of $\text{RT}_k^n$ first-order arithmetic

## Lemma

Let  $n \geq 3$  and  $(M; X) \models \text{RCA}_0 + \text{RT}_2^n$ . If  $M \models \text{I}^{\setminus}$ , then  $0^{(\setminus)} \leq X$ .  
As a consequence,  $\setminus_{+1}\text{-Def}(M) \leq X$  and  $M \models \text{B}^{\setminus_{+1}}$ .

## Proof idea.

For  $\setminus = 1$  we take the usual computable colouring of triples whose solutions compute  $\emptyset$

for  $x < y < z$  let  $c(x; y; z) = 0$  if there is a Turing machine with a code below  $x$  that halts below  $z$  but not below  $y$ .

To check whether  $\setminus_e(e) \neq \emptyset$  take any  $x; y \leq H$  such that  $e < x < y$  and execute the computation  $\setminus_e$  on  $e$  till the step  $y$ .

Thus  $\emptyset \leq X$  and also  $\setminus_2\text{-Def}(M) \leq X$  and  $M \models \text{B}^{\setminus_2}$ .

For the other cases proceed by induction up to  $n$  and relativize the case of  $\setminus = 1$ . □

# First-order consequences of $\mathcal{RT}$

Let  $R^n$  denote the first-order consequences of  $\mathcal{RT}$ . Then:

- |  $R^n$  is axiomatized by  $B_1 + \text{exp}$  and the set  $\{ \text{fl } \cdot \cdot \} \cup B_{\neq+1} \wedge (I_{\neq+1} \rightarrow \neq+1 - \text{RT}_k^n) : \neq+1 \text{lg}$ ,

# First-order consequences of $\mathbb{R}$

Let  $R^n$  denote the first-order consequences of  $\mathbb{R}$ . Then:

- |  $R^n$  is axiomatized by  $B_1 + \text{exp}$  and the set  $\{ \text{f.l.} \} \cup B_{+1} \wedge (I_{+1} \rightarrow \text{RT}_k^n) : k \geq 1$ ,
- | it is strictly contained in PA,

# First-order consequences of $\mathbb{R}T$

Let  $R^n$  denote the first-order consequences of  $\mathbb{R}T$ . Then:

- |  $R^n$  is axiomatized by  $B_1 + \text{exp}$  and the set  $\{ (I_{k+1} \wedge (I_{k+1} \rightarrow I_{k+1} - RT_k^n)) : k \geq 1 \}$ ,
- | it is strictly contained in PA,
- | its  $\Sigma_3$ -part is  $B_1 + \text{exp}$ ,
- | for  $k \geq 1$ , its  $\Sigma_{k+3}$ -part lies strictly in between  $B_1 + \text{exp} + \bigvee_{j \leq k} (I_j \wedge B_{j+1})$  and  $B_{k+1}$ .

# First-order consequences of $\text{RT}_k^n$

Let  $R^n$  denote the first-order consequences of  $\text{RT}_k^n$ . Then:

- |  $R^n$  is axiomatized by  $B_1 + \text{exp}$  and the set  $\{ (I_{j+1} \rightarrow B_{j+1}) \mid j \in \mathbb{N} \}$ ,
- | it is strictly contained in PA,
- | its  $\Sigma_3$ -part is  $B_1 + \text{exp}$ ,
- | for each  $j \geq 1$ , its  $\Sigma_{j+3}$ -part lies strictly in between  $B_1 + \text{exp} + \{ (I_j \rightarrow B_{j+1}) \}$  and  $B_{j+1}$ .

From the proof of the last two items it follows that for each  $j \geq 1$ ,  $n; k \geq 2$ , the theory  $B_j + \{ (I_j \rightarrow B_{j+1}) \}$  is consistent and thus  $\text{RT}_k^n$  is the optimal amount of induction to disprove  $\text{RT}_k^n$ .

# First-order consequences of $\mathcal{RT}$

Let  $R^n$  denote the first-order consequences of  $\mathcal{RT}$ . Then:

- |  $R^n$  is axiomatized by  $B_1 + \text{exp}$  and the set  $\{ (I_{j+1} \rightarrow I_{j+1} - RT_k^n) : j \geq 1, k \geq 2 \}$ ,
- | it is strictly contained in PA,
- | its  $\Sigma_3$ -part is  $B_1 + \text{exp}$ ,
- | for  $j \geq 1$ , its  $\Sigma_{j+3}$ -part lies strictly in between  $B_1 + \text{exp} + \bigvee_{i=1}^j (I_i \rightarrow B_{i+1})$  and  $B_{j+1}$ .

From the proof of the last two items it follows that for each  $j \geq 1$ ,  $n; k \geq 2$ , the theory  $B_j + \bigvee_{i=1}^j (I_i \rightarrow B_{i+1}) - RT_k^n$  is consistent and thus  $j$  is the optimal amount of induction to disprove  $\bigvee_{i=1}^j (I_i \rightarrow B_{i+1}) - RT_k^n$ .

Example of a model of  $B_1 + \bigvee_{i=1}^j (I_i \rightarrow B_{i+1}) - RT_2^n$ : take a model  $M \models B_1 + \text{exp}$  with  $\text{SSy}(M) = RT_k^n$  and trim it to some  $M^0$  in which  $!$  is  $\Sigma_1$ -definable. Then  $(M^0; \Sigma_1\text{-Def}(M)) \models B_1 + RT_k^n$  and thus  $M^0 \models B_1 + \bigvee_{i=1}^j (I_i \rightarrow B_{i+1}) - RT_2^n$ .

## Results for $\mathcal{R}_2^2$ over $\text{RCA}_0$

Let  $\mathcal{R}^2$  denote the first-order consequences of  $\text{RCA}_0 + \text{ART}_2^2$ . Then:

- |  $\mathcal{R}^2$  follows from  $\Pi_2^1$  (By Cholak, Jockusch, Slaman).
- | Over:  $\Pi_1^1$ ,  $\mathcal{R}^2$  is equivalent to  $\Pi_1\text{-RT}_2^2$ .
- | The  $\Sigma_3^1$ -part of  $\mathcal{R}^2$  is  $\text{B}_1 + \text{exp}$ .

# Results for $R^2$ over $RCA_0$

Let  $R^2$  denote the first-order consequences of  $RCA_0 + ART_2^2$ . Then:

- |  $R^2$  follows from  $I_2$  (By Cholak, Jockusch, Slaman).
- | Over:  $I_1$ ,  $R^2$  is equivalent to  $I_1 + RT_2^2$ .
- | The  $\Sigma_3$ -part of  $R^2$  is  $B_1 + exp$ .
- | The  $\Sigma_4$ -part of  $R^2$  is strictly weaker than  $B_2$  but does not follow from  $I_1$ :
- | the  $\Sigma_2$  cardinality scheme  $C_2$ , is a  $\Sigma_4$ -sentence that follows from  $RCA_0 + RT_2^2$  but  $I_1 \not\vdash C_2$  (an automorphism argument).

$C_2 =$  „There is no  $\Sigma_2$ -definable injection with domain  $\mathbb{N}$  and a bounded range.“

# Principles weaker than $\mathbb{R}_2^2$

- CAC** = For every partial order  $(\mathbb{N}; \leq)$  there exists an infinite set  $S \subseteq \mathbb{N}$  which is a  $\leq$ -chain or  $\leq$ -antichain.
- ADS** = For every linear order  $(\mathbb{N}; \leq)$  there exists an infinite set  $S \subseteq \mathbb{N}$  which is an  $\leq$ -ascending or  $\leq$ -descending sequence.
- $\text{CRT}_2^2$**  = for every  $c: [\mathbb{N}]^2 \rightarrow \{0, 1\}$  there exists an infinite  $S \subseteq \mathbb{N}$  such that  $c \upharpoonright S$  is stable, i.e. for every  $x \in S$  there exists  $y \in S$  such that for all  $z \in S$  if  $z \leq y$ , then  $c(x; y) = c(x; z)$ .

# Principles weaker than $\text{RT}_2^2$

$\frac{0}{2}$ -separation: For every two disjoint  $\frac{0}{2}$ -de nable sets  $A_0, A_1$  there exists a  $\frac{0}{2}$ -de nable set  $B$  such that  $A_0 \subseteq B$  and  $A_1 \subseteq \overline{B}$ .

**$\frac{0}{2}$ -separation:** For every two disjoint  $\frac{0}{2}$ -de nable sets  $A_0, A_1$  there exists a  $\frac{0}{2}$ -de nable set  $B$  such that  $A_0 \subseteq B$  and  $A_1 \subseteq \overline{B}$ .

## Lemma

$RCA_0 \not\vdash COH \Rightarrow \frac{0}{2}$ -separation.

$RCA_0 \not\vdash COH \Rightarrow \frac{0}{2}$ -separation was proved by Belanger in 2015.

**$\Sigma_2^0$ -separation:** For every two disjoint  $\Sigma_2^0$ -definable sets  $A_0, A_1$  there exists a  $\Sigma_2^0$ -definable set  $B$  such that  $A_0 \subseteq B$  and  $A_1 \subseteq \overline{B}$ .

## Lemma

$\text{RCA}_0 \not\vdash \text{COH} \Rightarrow \Sigma_2^0\text{-separation}$ .

$\text{RCA}_0 \not\vdash \text{COH} \Rightarrow \Sigma_2^0\text{-separation}$  was proved by Belanger in 2015.

## Proof sketch.

Given two  $\Sigma_2^0$ -sets  $A_0, A_1$  such that  $A_0 \cap A_1 = \emptyset$  we look for a  $\Sigma_2^0$ -set  $B$  such that  $B \supseteq A_0$  and  $\overline{B} \supseteq A_1$ .

**$\Sigma_2^0$ -separation:** For every two disjoint  $\Sigma_2^0$ -definable sets  $A_0, A_1$  there exists a  $\Sigma_2^0$ -definable set  $B$  such that  $A_0 \subseteq B$  and  $A_1 \subseteq \overline{B}$ .

### Lemma

$\text{RCA}_0 \not\vdash \text{COH} \Rightarrow \Sigma_2^0\text{-separation}$ .

$\text{RCA}_0 \not\vdash \text{COH} \Rightarrow \Sigma_2^0\text{-separation}$  was proved by Belanger in 2015.

### Proof sketch.

Given two  $\Sigma_2^0$ -sets  $A_0, A_1$  such that  $A_0 \cap A_1 = \emptyset$  we look for a  $\Sigma_2^0$ -set  $B$  such that  $B \supseteq A_0$  and  $\overline{B} \supseteq A_1$ .

One can define a computable function  $f: \mathbb{N} \times \mathbb{N} \rightarrow \{0, 1\}$  such that

$$f(s) = \langle f(n; s) \rangle_{n \in \mathbb{N}}$$

is unbounded  $\nexists n \in A_i$ :

**$\Sigma_2^0$ -separation:** For every two disjoint  $\Sigma_2^0$ -definable sets  $A_0, A_1$  there exists a  $\Sigma_2^0$ -definable set  $B$  such that  $A_0 \subseteq B$  and  $A_1 \subseteq \overline{B}$ .

### Lemma

$\text{RCA}_0 \not\vdash \text{COH} \Rightarrow \Sigma_2^0\text{-separation}$ .

$\text{RCA}_0 \not\vdash \text{COH} \Rightarrow \Sigma_2^0\text{-separation}$  was proved by Belanger in 2015.

### Proof sketch.

Given two  $\Sigma_2^0$ -sets  $A_0, A_1$  such that  $A_0 \cap A_1 = \emptyset$  we look for a  $\Sigma_2^0$ -set  $B$  such that  $B \subseteq A_0$  and  $\overline{B} \subseteq A_1$ .

One can define a computable function  $f: \mathbb{N} \times \mathbb{N} \rightarrow \{0, 1\}$  such that

$$f(n; s) = 1 \text{ if } n \in A_0 \text{ and } s \text{ is bounded, otherwise } f(n; s) = 0.$$

Define a computable sequence of sets  $R_n = \{s : f(n; s) = 0\}$  and let  $C$  be cohesive for this sequence. Put  $B = \bigcup_{n \in C} R_n$ .  $\square$

## Lemma

$B_{1 + \exp}$  proves that there exist two disjoint  $2$ -sets that cannot be separated by a  $2$ -set.

## Lemma

$B_1 + \text{exp}$  proves that there exist two disjoint  $\Sigma_2$ -sets that cannot be separated by a  $\Sigma_2$ -set.

**Proof sketch.** Take  $A_0 = \{e \in \mathbb{N} : \varphi_e^{0^0}(e) = 0\}$  and  $A_1 = \{e \in \mathbb{N} : \varphi_e^{0^0}(e) = 1\}$  and check that with a careful formalisation of basic computability theory it goes through in

$B_1 + \text{exp}$ . (Cf. Chong and Yang The jump of a  $\Sigma_n$ -cut.) □

## Lemma

$\text{B}_1 + \text{exp}$  proves that there exist two disjoint  $\Sigma_2$ -sets that cannot be separated by a  $\Sigma_2$ -set.

**Proof sketch.** Take  $A_0 = \{e \in \mathbb{N} : \varphi_e^{0^0}(e) = 0\}$  and  $A_1 = \{e \in \mathbb{N} : \varphi_e^{0^0}(e) = 1\}$  and check that with a careful formalisation of basic computability theory it goes through in  $\text{B}_1 + \text{exp}$ . (Cf. Chong and Yang The jump of a  $\Sigma_n$ -cut.)  $\square$

COH is never computably true over  $\text{RCA}_0$

## Theorem

If  $(M; \Sigma_1\text{-Def}(M)) \models \text{RCA}_0$  then  $(M; \Sigma_1\text{-Def}(M)) \not\models \text{COH}$ .

## Lemma

$\mathcal{B}_1 + \text{exp}$  proves that there exist two disjoint  $\Sigma_2$ -sets that cannot be separated by a  $\Sigma_2$ -set.

**Proof sketch.** Take  $A_0 = \{e \in \mathbb{N} : \varphi_e^{00}(e) = 0\}$  and  $A_1 = \{e \in \mathbb{N} : \varphi_e^{00}(e) = 1\}$  and check that with a careful formalisation of basic computability theory it goes through in  $\mathcal{B}_1 + \text{exp}$ . (Cf. Chong and Yang The jump of a  $\Sigma_n$ -cut.)  $\square$

COH is never computably true over  $\text{RCA}_0$

## Theorem

If  $(M; \Sigma_1\text{-Def}(M)) \models \text{RCA}_0$  then  $(M; \Sigma_1\text{-Def}(M)) \not\models \text{COH}$ .

**Proof.** In every structure of the form  $(M; \Sigma_1\text{-Def}(M))$   $\Sigma_2$ -sets are precisely  $\Sigma_2$ -sets.  $\square$

## Lemma

$\Sigma_1^1 + \text{exp}$  proves that there exist two disjoint  $\Sigma_2^1$ -sets that cannot be separated by a  $\Sigma_2^1$ -set.

**Proof sketch.** Take  $A_0 = \{e \in \mathbb{N} : \exists e' (e' \leq e \wedge \varphi_{e'}(e) = 0)\}$  and  $A_1 = \{e \in \mathbb{N} : \exists e' (e' \leq e \wedge \varphi_{e'}(e) = 1)\}$  and check that with a careful formalisation of basic computability theory it goes through in  $\Sigma_1^1 + \text{exp}$ . (Cf. Chong and Yang The jump of a  $\Sigma_n^1$ -cut.)  $\square$

COH is never computably true over  $\text{RCA}_0$

## Theorem

If  $(M; \Sigma_1^1\text{-Def}(M)) \models \text{RCA}_0$  then  $(M; \Sigma_1^1\text{-Def}(M)) \not\models \text{COH}$ .

**Proof.** In every structure of the form  $(M; \Sigma_1^1\text{-Def}(M))$   $\Sigma_2^1$ -sets are precisely  $\Sigma_2^1$ -sets.  $\square$

Since there are models of  $\text{RCA}_0 \wedge \text{RT}_2^2$  of the form  $(M; \Sigma_1^1\text{-Def}(M))$  we obtain

## Corollary

$\text{RCA}_0 \wedge \text{RT}_2^2 \not\models \text{COH}$ .

# Questions

- | Does  $RT_2^3$  imply  $RT_2^4$  over  $RCA_0$ ?
