## 1D Vlasov-Poisson equations:

- *Time evolution of PDF* under electric/gravitational field in space-velocity phase space
- *Collisionless Boltzmann-Poisson*: self-gravitating stellar system; evolution pdf of star density in phase space
- *Kinetic plasmas*: numerical solution plays role in nonlinear behavior of plasmas; control of fusion dynamics

## Numerical methods:

- *Grid based*: problematic extension to 3D yielding 6D case
- *Particle based*: problem is **numerical noise**
- *Particle-mesh*: particle in cell, density on grid
- *Hamiltonian particle mesh method*: current topic

Hamiltonian particle mesh method (HMM):

- *Compatible scheme*: adhering to Hamiltonian structure of Vlasov-Poisson equations
- *E.g. in fluids*: compressible Euler, incompressible 2D streamfunction-vorticity, shallow water equations, hydrostatic equations (e.g. Frank et al. 2002, ...)
- *Consistent long-time statistics of HMM*: due to preservation (integral) conservation laws (Dubinkina and Frank 2010)
- *Goal*: design and test a **closure** for Hamiltonian finite element method for Vlasov-Poisson (& fluid) systems to overcome **numerical noise**.

## 2. Hamiltonian Parcel Vlasov-Poisson Dynamics

Equations of motion, dimensionless:

$$\partial_t \mathcal{D} + \zeta \partial_x \mathcal{D} - (\partial_x \phi) \partial_\zeta \mathcal{D} = 0 \quad (1)$$

$$\partial_{xx} \phi = 1 - \int_{-\infty}^{\infty} \mathcal{D}(x, \zeta, t) d\zeta \equiv 1 - \rho \quad (2)$$

- PDF  $\mathcal{D}(x, \zeta, t)$ , potential  $\phi(x, t)$  & density  $\rho(x, t)$
- space-velocity dimensions  $(x, \zeta)$  and time  $t$
- partial derivatives  $\partial_x = \partial/\partial x$  and  $\partial_\zeta = \partial/\partial \zeta$
- second order derivative  $\partial^2 \phi / \partial x^2 = \partial_{xx} \phi = \phi_{xx}$
- Characteristics: on

$$dx/dt = \zeta, \quad d\zeta/dt = -\partial_x \phi \quad \text{we find} \quad d\mathcal{D}/dt = 0$$

# Coupled Hyperbolic-Elliptic System

- The **hyperbolic part** can be solved on the characteristics

$$dx/dt = \zeta, \quad d\zeta/dt = -\partial_x \phi \quad (3)$$

- such that the PDF satisfies:

$$\begin{aligned} d\mathcal{D}/dt &= \partial_t \mathcal{D} + \frac{dx}{dt} \partial_x \mathcal{D} + \frac{d\zeta}{dt} \partial_\zeta \mathcal{D} \\ &= \partial_t \mathcal{D} + \zeta \partial_x \mathcal{D} - \partial_x \phi \partial_\zeta \mathcal{D} = 0 \end{aligned} \quad (4)$$

- Hence, it is frozen along characteristics:

$$\mathcal{D}(x, \zeta, 0) = \mathcal{D}_0(x_0, \zeta_0) \quad (5)$$

- The potential  $\phi$  follows from the **elliptic equation**:

$$\begin{aligned} \partial_{xx} \phi &= 1 - \int_{-\infty}^{\infty} \mathcal{D}(x, \zeta, t) d\zeta \\ &= 1 - \int_{-\infty}^{\infty} \int_0^L \mathcal{D}_0(x_0, \zeta_0) \delta(x - X(x_0, \zeta_0, t)) dx_0 d\zeta_0. \end{aligned} \quad (6)$$

# Hamiltonian Formulation

## Hamiltonian parcel formulation

$$\frac{dX}{dt} = \frac{\partial H}{\partial V} = V \quad \& \quad \frac{dV}{dt} = -\frac{\partial H}{\partial X} = -(\partial_x \phi)_{x=X} \quad (7a)$$

$$\partial_{xx} \phi = 1 - \rho \quad (7b)$$

$$\begin{aligned} \rho(x, t) &= \int_{-\infty}^{\infty} \mathcal{D}(x, \zeta, t) d\zeta \\ &= \int_{-\infty}^{\infty} \int_0^L \mathcal{D}_0(x_0, \zeta_0) \delta(x - X(x_0, \zeta_0, t)) dx_0 d\zeta_0 \quad (7c) \end{aligned}$$

- initial conditions  $X(x_0, \zeta_0, 0) = x$  &  $V(x_0, \zeta_0, 0) = \zeta$
- parcel PDF  $\mathcal{D}(x, \zeta, 0) = \mathcal{D}_0(x_0, \zeta_0)$  on labels  $(x_0, \zeta_0)$
- non-autonomous 1-parcel system (7) with Hamiltonian

$$H = H(X, V, t) = \frac{1}{2} V^2 + \phi(X, t) \quad (8)$$

# Constrained Variational Principle

Variational principle (VP):

$$\begin{aligned} 0 &= \int_0^T \mathcal{L}[X, V, \phi] dt \\ &= \delta \int_0^T \int_{-\infty}^{\infty} \int_0^L \mathcal{D}_0 V \frac{dX}{dt} - \frac{1}{2} \mathcal{D}_0 V^2 dx_0 d\zeta_0 + \int_0^L \frac{1}{2} (\partial_x \phi)^2 dx + \\ &\quad \int_0^L \phi \left( 1 - \int_0^L \int_{-\infty}^{\infty} \mathcal{D}_0 \delta(x - X(x_0, \zeta_0, t)) dx_0 d\zeta_0 \right) dx dt \end{aligned}$$

- Thanks to Mark Peletier who removed the Lagrange multiplier in an earlier approach.
- *Discretize VP* consistently, to obtain compatible scheme.

### 3. Hamiltonian Particle FEM

Discrete approximations  $\phi_h, \rho_h$  and test function  $\varphi_h$ :

$$\frac{dX_k}{dt} = \frac{\partial H_k}{\partial V_k} = V_k \quad (9a)$$

$$\frac{dV_k}{dt} = -\frac{\partial H_k}{\partial X_k} = -\partial_x \phi_h(x, t)|_{x=X_k}$$

$$X_k(0) = x_k \quad \text{and} \quad V_k(0) = \zeta_k \quad (9b)$$

$$-\int \partial_x \varphi_h(x) \partial_x \phi_h(x, t) dx = \int \varphi_h(x) dx - \int \varphi_h(x) \rho_h(x, t) dx$$

$$\int \varphi_h(x) \rho_h(x, t) dx = \sum_k \varphi_h(X_k) \mathcal{D}_{0k} w_{0k} \Delta_k \quad (9c)$$

- for  $k = 1, \dots, N_k$ ;  $x_k, \zeta_k$  quadrature points with
- weights  $w_{0k}$  and 2D finite element area  $\Delta_k$

# Hierarchical Orthonormal Basis Functions

Cubic spline fine & coarse expansion

$$\phi_h = \phi_j' \varphi_{j'} = \phi_I \varphi_I + \phi_\alpha \tilde{\varphi}_\alpha:$$

- Refine by steps of two, with **projection matrices**  $Q$  ( $N_s \times N_f$ ) and  $W$  ( $(N_f - N_s) \times N_f$ ), such that:

$$\varphi_I = Q_{Ij'} \varphi_{j'} \quad \text{and} \quad \tilde{\varphi}_\alpha = W_{\alpha j'} \varphi_{j'} \quad (12)$$

- Define the fine spline projection matrix  $A$  on the grid:  
 $A = \text{diag}(1/6, 2/3, 1/6)$  (a  $N_f \times N_f$  matrix).
- Using  $A$ , find **complementary matrix**  $WA$  as follows:

$$\begin{aligned} P(QA)^T &= (QA)^T \implies P = (QA)^T (QA(QA)^T)^{-1} (QA) \\ P &= Id + \tilde{P} \quad \text{with} \quad \tilde{P}(QA)^T = 0 \end{aligned} \quad (13)$$

- Then

$$WA = \text{null}(P) = \text{null}(\tilde{P}) \quad \text{and} \quad W = (WA)A^{-1}. \quad (14)$$

# Exact Variational Principle Coarse System

- Fine-scale potential (incl. **continuum limit**)

$$P = - \sum_{k', k^*} \frac{1}{2} \frac{\tilde{\varphi}_\alpha(X_{k^*}) S_{\alpha\gamma}^{-1} \varphi_\gamma(X_{k'}) \mathcal{D}_{0k^*} w_{0k^*} \Delta_{k^*} \mathcal{D}_{0k'} w_{0k'} \Delta_{k'}}{2} + \sum_{k'} \frac{\varphi_\alpha(X_{k'}) S_{\alpha\gamma}^{-1} R_\gamma \mathcal{D}_{0k'} w_{0k'} \Delta_{k'}}{k'} \quad (26)$$

$$\Rightarrow P_c = - \iint \frac{1}{2} \frac{\tilde{\varphi}_\alpha(X(x^*, \zeta^*, t)) S_{\alpha\gamma}^{-1} \tilde{\varphi}_\gamma(X(x', \zeta', t))}{2} \times \mathcal{D}_0(x', \zeta') \mathcal{D}_0(x^*, \zeta^*) dx' d\zeta' dx^* d\zeta^* + \int \frac{\tilde{\varphi}_\alpha(X(x', \zeta', t)) S_{\alpha\gamma}^{-1} R_\gamma \mathcal{D}_0(x', \zeta') dx' d\zeta'}{k'}$$

- We must approximate particles riding this **smoothened** fine-scale parcel potential  $P_c$ .
- Stochastic methods w. heavy/light particles ito PDF weights  $\mathcal{D}_0$  (e.g, Frank & Gottwald 2013)?

# Lagrangian Closure?

- For one  $\gamma$ , the potential term  $\tilde{\varphi}_\alpha S_{\alpha\gamma}^{-1} \tilde{\varphi}_\gamma$  for refinements ( $2\times, 8\times, 16\times$ ):

References

- **Variational principle** parcel Vlasov-Poisson system derived.
- Hamiltonian Particle Mesh method for Vlasov-Poisson system works: proper weak form.
- Hamiltonian Particle finite element method for Vlasov-Poisson system works; noisy density field with cubic Bernstein polynomials/splines.
- **Established Eulerian closure** by using coarse-fine hierarchical basis functions.
- **Lagrangian closure** is open. Link to a thermostat derivation? Use Mori-Zwanzig method (e.g., Bernstein 2007)?
- Extension to multi-dimensions and fluid systems? **Noise reduction!**
